Novel Therapeutic Target for Pulmonary Fibrosis/Scleroderma

OCR Number: OCR 57674445

Description:

- Fibrotic lung diseases represents a major unmet medical need, as effective treatment options are currently not available.
- Mice that overexpress TGF-β have identified several novel targets (including β1 integrin) for therapeutic interventions in fibrotic lung diseases.
- The blockade of β1 integrin significantly inhibits fibrosis (collagen formation).
- Semaphorin 7A inhibition (Figure B) is also effective as a therapeutic treatment for fibrotic disease.

Published/Issued Patents: U.S. Patent No. 8,642,357

Published/Issued Patents: U.S. Pub. App. No. 20140271639
