mGluR5 Modulator For Treatment of Alzheimer’s Disease

OCR Number: OCR 5708

Description:

- **mGluR5 Silent Allosteric Modulator For Treatment of Alzheimer’s Disease**

- **Background:** mGluR5 has been identified as part of a cell-surface complex that binds to Ab oligomers, which leads to synaptic loss and neuronal death.

- A small molecule silent allosteric modulator (SAM) has been identified that blocks Ab binding, but does not interfere with normal glutamate signaling.

- Treatment of AD mice with SAM improves memory and learning (Fig.1), and ameliorates synaptic loss (Fig.2).

- **Mechanism of Action:** SAM-Induced conformational changes in mGluR5 strongly reduce its interaction with cellular prion protein (PrPC), a cell-surface anchor for Alzheimer’s Aβ0, without affecting glutamate signaling.

- **IP status:** Extensive patent portfolio covers novel composition of matter and is available for licensing.

- **Lead Innovator:** Stephen M. Strittmatter, M.D., Ph.D.

PI: Stephen Strittmatter

**Licensing Contact:** John Puziss
