RNA Modulators of RIG-I

OCR Number: OCR 6056

Description:

RNA Hairpin Molecules as Immunomodulatory Agents

- **Background:** Short hairpin RNA molecules (shRNA) induce interferon production via Rig-I like receptor mechanism.
- Efficacy demonstrated in mouse models of viral infection (see figure on the right). Use in oncology is being investigated.
- Small molecule modulators of Rig-I also under investigation.
- **IP status:** Patent pending US 14-776,463.
- **Innovators:**
  Anna Pyle, Ph.D.,
  Akiko Iwasaki, Ph.D.

![Graph showing weight loss over days post infection with SLR10 and mock groups.]

Mx1 mice were inoculated intravenously with 25ug SLR10/PEI or untreated 16h prior to intranasal challenge with 10^5 pfu of Influenza A (A/PR8). Mice were weighed daily following infection. Infection dose was sub-lethal.
